

Experience

- 2025–Now **Senior AI Research Scientist**,
Noah's Ark Lab, Huawei Technologies Canada, Toronto, Canada
- * Working on audio foundation models (Large Audio-Language Models) for audio understanding and generation
 - * Working on Agentic AI Implementation for Audio Editing using LALMs
- 2022–2025 **AI Research Scientist**,
LG Electronics AI Lab, Toronto, Canada
- * Utilized LLMs and Generative Models to Generate Data for Low Resource Audio-Based Tasks.
 - * Worked on multimodal cognition in smart home environments.
 - * Responsible For Deep Learning Solution For Audio Perception and Speech.
 - * Worked on Room Impulse Response and Acoustic Behaviour From Room Images.
- 2021–2022 **Machine Learning Engineer**,
IMRSV Data Labs, Ottawa, Canada
- * Researched and Developed an End-to-End Speech-to-Speech Translation Systems.
 - * Responsible For Automated Speech Recognition Models That Fit on Mobile Devices.
- 2016–2018 **Senior Software Engineer**,
AEC, Tehran, Iran
- * Lead a team of 4 to develop web APIs using Django and Flask
 - * Developed an automation platform for Cellphone coverage tracking using Django, and AngularJs

Education

- 2018–2022 **Ph.D. Artificial Intelligence**,
Queen's University
- Worked on audio-based deep learning solutions for smart meeting rooms with a focus on deep speaker representation learning. The speaker representations can be used for speaker identification and emotion recognition during the meetings which helps the meeting organizers to have: a) a better automated minute extraction system b) a better sense of the emotional/cognitive state of the attendees so that they can organize the meetings more efficiently
- 2014–2016 **M.Sc. Computer Science**,
University of Tehran
- Used a combination of language models and finite-state transducers to develop a correction model for white space misplacement. Using a finite-state transducer with weights assigned from language models, the proposed solution was able to accurately correct the misplaced white spaces in cases where the separated sub-words could be considered meaningful words
- 2008–2013 **B.Sc. Computer Engineering**,
Zanjan University
- Implemented an inefficient data-gathering and reporting web service using python for tenure candidate assessment. By optimizing the dataset structure and queries, I was able to drastically enhance the performance of data-gathering and reporting system. I further improved the system by adding an automated publication registration using crawler agents.

Tools and Skills

Programming Languages: Python

Deep Learning Libraries: Pytorch, Tensorflow

Tools and Concepts: Agentic AI (Pydantic, Langchain, SmolAgents)

Methods and Software: Agile, Git, Docker

Platforms and Services: Google Cloud Platform, Sun Grid Engine, AWS
